Protocol Article

An all-inclusive approach: A universal protocol for the successful amplification of four genetic loci of all Oniscidea [☆]

Andreas C. Dimitriou*, Spyros Sfenthourakis

Department of Biological Sciences, University of Cyprus, Panepistimiou Ave. 1, 2109, Aglantzia, Nicosia, Cyprus

ABSTRACT

Accounting more than 3,700 described species, Oniscidea is the largest and at the same time the only terrestrial isopod suborder inhabiting almost all terrestrial biomes. Despite the great effort dedicated on describing taxonomic diversity of Oniscidea, mainly employing morphology, there is still a considerable number of species/genera of uncertain generic/familiar assignment. Based on different morphological characters, alternative evolutionary relationships have been proposed to describe the diversity of Oniscidea at different phylogenetic levels. Accumulating morphological and genetic data are repeatedly challenging the monophyly of established taxa, undermining the validity of several morphological characters traditionally used in terrestrial isopod taxonomy, leading to often revisions of the current taxonomy of the Oniscidea. The use of genetic data facilitates the efforts to reconstruct the complex evolutionary history of the focal group by providing important data for the identification, delimitation, and description of species. The proposed protocol with universal PCR conditions and primers was used to successfully amplify COI, 16S, 28S and NaK loci in diverse Oniscidea taxa. The application of this protocol is anticipated to facilitate the generation of new genetic data and hence promote scientific research in Isopoda taxonomy, evolution, ecology, and other related fields.

SPECIFICATIONS TABLE

Subject Area;	Biochemistry, Genetics and Molecular Biology
More specific subject area;	PCR, Gene amplification
Protocol name;	A universal protocol for the successful amplification of four genetic loci of all Oniscidea
Reagents/tools;	PCR machine Primer A Primer B dNTPs $MgCl_2$ Taq polymerase Taq buffer
Experimental design;	Herein we propose a universal easy and cost-effective way to produce genetic data for all Oniscidea. Multiple combinations and newly designed primers were tested under the same amplification conditions at a wide variety of taxa. Using the same primers for all targeted taxa the same gene fragments are targeted and hence produced data could be used to generate new or enrich existing datasets.
Trial registration;	N/A
Ethics;	N/A
Value of the Protocol;	<ul style="list-style-type: none"> • Universal for all Oniscidea • Simple and easy to follow protocol • Sequencing of the most popular genetic markers for taxonomic and phylogenetic studies • Cost effective

Description of protocol: Touchdown PCR was initially developed as a modification to traditional PCR aiming to increase the specificity and sensitivity of amplification [1–3]. The sensitivity of the proposed protocol was tested for four commonly targeted genetic loci for many taxonomically diverse taxa. The proposed protocol could be used to generate mitochondrial (16S, COI) and nuclear (28S, NaK) data.

Required reagents and equipment

PCR thermal cycler

PCR tubes

Sterile 1.5 mL Eppendorf style microcentrifuge tubes

Benchtop microcentrifuge

Adjustable micropipettes (0.1–1,000 mL)

Micropipette tips (10–1,000 mL) dNTPs

 $MgCl_2$

Taq polymerase

Taq Buffer

Primers ([Table 1](#))**Table 1**

Proposed primers for each locus.

Gene	Primer name	5' -Sequence -3'	Product size	Reference
COI	LCO1490	GGT CAA CAA ATC ATA AAG ATA TTG G	~560	[4]
	IsoCoiRint	GCY CCY GCY AAW ACA GGK ARD GA		[5]
16S	16sTRF	CTG ACT GTG CTA AGG TAG CA	~375bp	This study
	16sTRH	CGG TYT GAA CTC AGA TCA YGT GA		
28S	28S a	GAC CCG TCT TGA AAC ACG GA	350bp – 800bp	[6]
	28S b	TCG GAA GGA ACC AGC TAC TA		
NaK	NakForb	ATG ACA GTT GCT CAT ATG TGG TT	~600bp	[7]
	Nak638R	GGD RGR TCR ATC ATD GAC AT		[8]

Method details

The proposed final reaction volume is 20 μL and consists of 0.1 μL of Taq DNA Polymerase (5U/ μL), 2.4 μL of 25 mM MgCl₂, 1X of Taq buffer A, 0.6 μL of 10 mM dNTPs, 0.6 μL of each primer (10 μM ; Table 1) and >2 ng of DNA template in case of COI and 16s or >10ng in case of 28s and NAK. In any case the use of more than 100ng as DNA template should be avoided. The proposed protocol works effectively with samples of high DNA purity i.e.. A260/A280 rates over 1.5.

Thermocycling conditions for all four proposed genes should be as follows:

- a) 94°C 10 min initial denaturation 1 cycle
- b) 94°C 60s, 55°C 60s, 72°C 60s for 5 cycles
- c) 94°C 60s, 50°C 60s, 72°C 60s for 5 cycles
- d) 94°C 60s, 47°C 60s, 72°C 60s for 32 cycles
- e) 94°C 60s, 42°C 60s, 72°C 60s for 7 cycles
- f) 72°C 10 min final extension 1 cycle
- g) Hold 10°C

The proposed protocol works efficiently even at very low DNA concentrations (<2ng), ill preserved or very old specimens. If aspecific products are amplified under these conditions an alternative, stricter thermocycling profile should be followed:

- a) 94°C 10 min initial denaturation 1 cycle
- b) 94°C 60s, 55°C 60s, 72°C 60s for 10 cycles
- c) 94°C 60s, 50°C 60s, 72°C 60s for 10 cycles
- d) 94°C 60s, 47°C 60s, 72°C 60s for 30 cycles
- e) 72°C 10 min final extension 1 cycle
- f) Hold 10°C

PCR products may be visualized using a common agarose gel electrophoresis. Successfully amplified samples should be purified using any commercial purification protocol following the manufacturer's instructions before proceeding with sequencing. Cycle sequencing can be performed with the same primers used for the initial PCR reaction.

Validation

The effectiveness of the proposed protocol was tested for all available specimens, representing 142 species in 97 genera and 22 families, representing a diverse cross-section of the Oniscidea. Beyond terrestrial isopods, the same protocol was also successfully applied for representatives of the isopod orders Valvifera, Sphaeromatidea and Asellota.

Generated data were deposited in NCBI GenBank (Table 2). A limited number of sequences produced from our group within the framework of other projects, using a very similar protocol, were already published within the framework of previous studies and their corresponding accession numbers are given in Table 1. [8,9]. Although the new protocol using proposed thermocycling profile and primers were successfully tested in these cases too.

Table 2

Species, locality of origin and GenBank accession numbers of individuals used for the protocol validation. Isolate codes with stars (*) indicate that they were previously published [8,9].

Conclusion

Taking advantage of the universal and cost-effective nature of the proposed protocol a new potential for the production of genetic data could be foreseen. Based on this protocol retrieved data could be included in multiple datasets given that the same gene regions are targeted. Beyond the data published within the framework of this study, scientific research in related fields such as Isopod systematics, evolution, phylogeny e.t.c. could be facilitated by the application of the proposed protocol. It is worth noting that the majority of available specimens were collected more than two decades ago and a considerable number of them were ill-preserved for a long time (i.e., in 70% alcohol or formaldehyde). Hence, the absence of data in some cases might be attributed to the bad quality of extracted DNA or the lack of effort since we did not aim to sequence all loci for all specimens.

Data availability

All data were deposited in NCBI Genbank. Accession numbers are provided in the main text.

Declaration of Competing Interest

The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

Data Availability

All data were deposited in NCBI Genbank. Accession numbers are provided in the main text.

Acknowledgments

Authors would like to thank Jana Bedek, Stefano Taiti, Konstantin Gongalsky, Ghasem Kashani, Helmut Schmalfuss, Kaloust Paragamian and Emmanuel Séchet for their valuable contribution of isopod material used in the present study. We would also like to thank Emmanouela Karameta and Katerina Balanika for assistance in field collecting in Cyprus. The present work was partially funded by the Project EXCELLENCE/0918/0161 (co-financed by the European Regional Development Fund and the Republic of Cyprus) through the Research and Innovation Foundation and University of Cyprus internal research funds.
